

This proposal would be the death of Amateur Radio or SWL'ing because of the gross amounts of Interference that would occur in small towns where the power company has difficulty in keeping rf interference down to s-5 levels from leaky transformers and connectors. Adding Broadband RF to this already poor system would probably result in interference levels well over s-9. PLease do not approve this proposal. Cable and phone line Broadband should provide enough space for the future use of the Internet both Business and Private. Power Companies have demonstrated over the approximately twenty years I have been a Ham that they do not want to respond to interference complaints. The Cable and Phone Industries have a much better record.
